In the winter of 1893 the ice reached the outer skerries, something no one in the village had seen before. The keeper walked across to the nearest island with his son, measured the ice with an auger and wrote that it was thicker than the kitchen table and twice as level. The station was modernised in stages. A clockwork rotation mechanism replaced the hand-cranked one in 1902, an acetylene burner arrived in 1923, and electricity followed in 1951, carried across the sound on a cable that the fishermen swore would never hold.
